Abstract

In a method for the correction of video signals whose
processing is distributed between a plurality of
segments having different transfer characteristics, it
is provided that, from values in each case of a
predetermined number of pixels before the boundary of
two segments, the value of at least one pixel lying
after the boundary is estimated in each case, and that
correction values are derived from differences between
the at least one estimated value and the actual value
of the at least one pixel of the following segment that
lies after the boundary.
